6.4.2 Geometric Simplicity . . . . .	91

# Chapter 1

## Introduction

### 1.1 The Main Results

Let  $A$  be an abelian variety defined over a number field  $F$ ,  $K$  a finite extension of  $F$ . The Birch and Swinnerton-Dyer (BSD, in short) conjecture for  $(A, K)$  predicts that the rank of the Mordell-Weil group  $A(K)$  is equal to the vanishing order at  $s = 1$  of the L-function  $L(s, A/K)$  of  $A$  over  $K$ :

$$\text{rank}_{\mathbb{Z}} A(K) = \text{ord}_{s=1} L(s, A/K). \quad (1)$$

There is a refined version of the BSD conjecture on the leading coefficient of the Taylor expansion at  $s = 1$  of the L-function in term of arithmetic invariants of  $A$  (see §1.2). In this book, we give some evidence to these conjectures.

Assume that  $A$  is an abelian variety over a totally real field  $F$ , and is associated with an automorphic form  $\phi$  for  $\text{GL}_{2,F}$  of weight  $(2, \dots, 2)$ , conductor  $N$ , and with trivial central character, in the sense that

$$L_v(s, A) = \prod_{\sigma} L_v(s - \frac{1}{2}, \phi^{\sigma}),$$

for all finite places  $v$  of  $F$ , where  $\phi^{\sigma}$  are all distinct conjugations of  $\phi$  under  $\sigma \in \text{Aut}(\mathbb{C})$ . Then  $A$  has real multiplication over  $F$  by the subring  $\mathbb{Z}[\phi]$  of  $\mathbb{C}$  generated over  $\mathbb{Z}$  by Hecke eigenvalues of  $\phi$ . By an isogenous, we may assume  $A$  has full real multiplication by  $\mathcal{O}_{\phi}$ , the integral closure of  $\mathbb{Z}[\phi]$ . Let  $K/F$  be a totally imaginary quadratic extension with discriminant prime to  $N$ . Using the generalization of Gross-Zagier formula to totally real fields by the second author [24], we know that if  $\text{ord}_{s=1/2} L(s, \phi_K) \leq 1$  then

$$\text{ord}_{s=1} L(s, A/K) = [\mathcal{O}_{\phi} : \mathbb{Z}] \cdot \text{ord}_{s=1/2} L(s, \phi_K). \quad (2)$$

**Theorem 1.1.1.** *If  $\text{ord}_{s=1/2} L(s, \phi_K) = 1$ , then  $\text{rank}_{\mathbb{Z}} A(K) = \text{ord}_{s=1} L(s, A/K)$  and the Shafarevich-Tate group  $\text{III}(K, A)$  is finite.*

*If  $\text{ord}_{s=1/2} L(s, \phi_K) = 0$  and  $A$  does not have complex multiplication, then  $A(K)$  is finite. If furthermore,  $A$  is geometrically simple, then  $\text{III}(K, A)$  is also finite.*

With a non-vanishing result [10], we have
